Abstract not available for AU744404

Abstract of correspondent: **EP0887100**

The filter has an elongated housing (1) with two flow chambers separated by a membrane. the flow chambers are formed preferably by hollow fibre bundles, in which the fibre hollows form one chamber and the surrounding space forms the other. Each flow chamber preferably has a single connector. The connectors (8-11) are all located on one side of the housing, are tubular in cross-section and are all in parallel in the same plane. Also claimed is a push-fit attachment by means of which the filter is incorporated in a fluid circuit.
